

ABSTRACT

An apparatus for moving a food item from one surface to another. The apparatus comprises a pair of substantially identical plate members. Each plate member has a generally flat surface formed in the shape of a semi-circle and a handle formed on the semi-circular side of the 5 generally flat surface. The two members may be separately slid under the food item and placed together along their respective first ends to cooperate in forming a base to more easily move the food item from one surface to another surface.
